

The zen of Python

Beautiful is better than ugly.

Errors should never pass silently.

Explicit is better than implicit.

Unless explicitly silenced.

Simple is better than complex.

In the face of ambiguity, refuse the temptation to guess.

Complex is better than complicated.

There should be one—and preferably only one—obvious way to do it.

Flat is better than nested.

Sparse is better than dense.

Now is better than never.

Readability counts.

Although never is often better than *right* now.

Special cases aren't special enough to break the rules.

If the implementation is hard to explain, it's a bad idea.

Although practicality beats purity.

If the implementation is easy to explain, it may be a good idea.
